

I urge the commission to look favorably upon the petition RM-10765. With very few skills, any person in the United States with the proper, inexpensive equipment would still be able to receive important information during a national emergency, even if all other forms of information dissemination were rendered inoperative.

With numerous sites located within the U.S., all broadcasting the same data at the same time, the chances are very favorable that important information would still be received much like the Ground Wave Emergency Network (GWEN) system of the U.S. Air Force.

With the information being printed out as it is being transmitted, there would be less of a chance of errors in copying the information or in misunderstanding the meaning of the message being sent.
